
DATA MANAGER™

Reduce Costs and Improve Performance with Intelligent Archiving

Overview

- Control storage usage growth, without growing your IT staff.
- Achieve an optimal balance between application performance, data access speeds and storage cost containment.
- Quickly and easily create current, realistic test databases.

Data Manager is an advanced data archiving tool from Vision Solutions that eliminates the burden of obsolete data. Undeleted outdated data not only adds to your storage costs, but it also bogs down queries, reports and online applications, which hampers productivity and frustrates users.

Data purges are often deferred because most archiving tools, including the embedded Purge/Archive facilities in most ERP systems, require a total application shutdown. In contrast, Data Manager runs most of its processes while your systems are active, without affecting users.

Built with highly autonomic technology, Data Manager provides a simple interface to manage all data purge and archive processes—from the identification of redundant and unused data to the automated periodic deletion, copying and/or archiving of it. And Data Manager helps you to adhere to the strictest of auditing standards by keeping a complete audit trail of all data archiving and purging activity.
